1.0 General Description

1.1 Product Description

The Equipment under Test (EUT) is Multi Trunk-Tracking Handheld Scanning Receiver, model PRO-97

Please refer to the attached specifications sheets in Appendix A for more details.

A pre-production version of the sample was received on October 8, 2004 in good condition. As declared by the Applicant, it is identical to production units.

1.2 Related Submittal(s) Grants

This is a single Application for Certification of a scanning receiver.

1.3 Test Methodology

Both conducted (if applicable) and radiated emission measurements were performed according to the procedures in ANSI C63.4 (1992). All radiated measurements were performed in a semi-anechoic chamber. Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the **“Data Section”** of this Application.

1.4 Test Facility

The test site and conducted measurement facility used to collect the radiated data is Site 1 (10-m semi-anechoic chamber). This test facility and site measurement data have been fully placed on file with the FCC and A2LA accredited.

2.0 System Test Configuration

2.1 Justification

The tests were performed according to the test procedure as outlined in CFR47 Part 15.31 and in ANSI C63.4.

For emission testing, the equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). During testing, all cables were manipulated to produce worst-case emissions.

For the measurements, the EUT is placed on top of a non-conductive table. If the EUT attaches to peripherals, they are connected and operational (as typical as possible).

For radiated emission measurements, the signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three-meter reading using inverse scaling with distance if measured at a closer distance.

2.2 EUT Exercising Software

The unit was setup to receive continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing.

2.3 Mode of Operation

The EUT was tested in two modes:

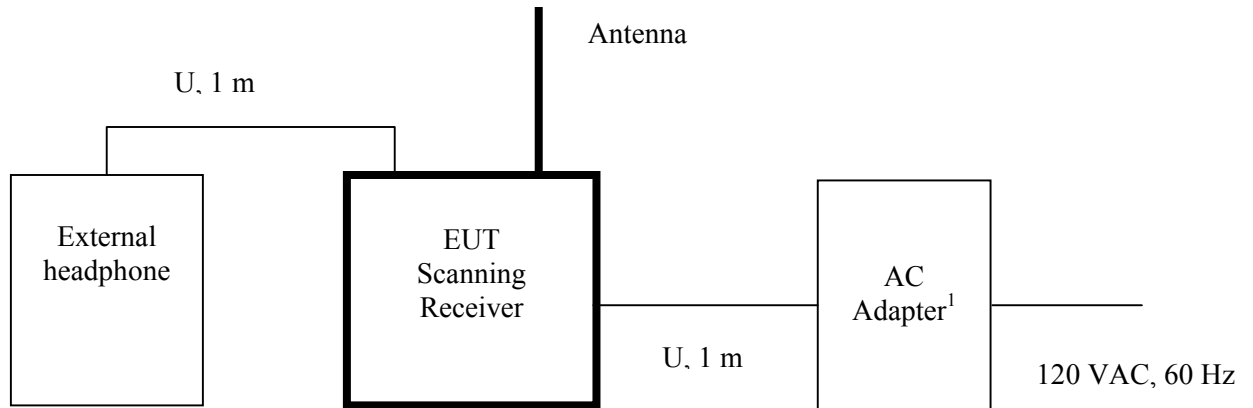

Test Mode 1: The EUT was set to constantly receive at the low, middle and high channels of each band.

Test Mode 2: The EUT was set to constantly scan a particular band.

2.4 Support Equipment List and Description

Item #	Description	Model No.	Serial No.

2.5 Equipment Setup Block Diagram

¹The AC adapter is manufactured by RadioShack®, Part number JOD(M)-48-A641

2.6 Equipment Modification

Any modifications installed previous to testing by GRE will be incorporated in each production model sold/leased in the United States.

Intertek Testing Services installed no modifications.

3.0 Emission Test Results

AC line conducted emission measurements were performed from 0.15 MHz to 30 MHz. Analyzer resolution is 10 kHz or greater.

Radiated emission measurements and antenna conducted emission measurements were performed from 30 MHz to 5000 MHz. Analyzer resolution is 100 kHz or greater for frequencies from 30 MHz to 1000 MHz, 1 MHz - for frequencies above 1000 MHz.

Preliminary tests were performed to determine the worst-case emission with the EUT tuned to the low, middle and high channels of each band. From these preliminary measurements the EUT was tuned to the frequency with the highest emission and the final scan was performed using the automated test software.

The same procedure was used to determine the worst-case emission level with the EUT setup in scanning mode for each band.

The final recorded data reflects the worst-case result.

A sample calculation, and data tables of the emissions are included.

All measurements were performed with peak detection unless otherwise specified.

3.1 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG + DF$$

Where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude (including preamplifier) in dB(μ V)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB(1/m)

AG = Amplifier Gain in dB

DF = Distance Factor in dB

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antennas factor of 7.4 dB(1/m) and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving field strength of 32 dB(μ V/m). This value in dB(μ V/m) was converted to its corresponding level in μ V/m.

$$RA = 52.0 \text{ dB}(\mu\text{V})$$

$$AF = 7.4 \text{ dB}(1/\text{m})$$

$$CF = 1.6 \text{ dB}$$

$$AG = 29.0 \text{ dB}$$

$$DF = 0 \text{ dB}$$

$$FS = 52 + 7.4 + 1.6 - 29.0 + 0 = 32 \text{ dB}(\mu\text{V}/\text{m})$$

$$\text{Level in } \mu\text{V}/\text{m} = \text{Common Antilogarithm } [(32 \text{ dB}\mu\text{V}/\text{m})/20] = 39.8 \mu\text{V}/\text{m}$$

3. OPERATING CONTROLS AND CONNECTIONS

3.1 Volume control with power switch

- 3.2 Squelch control
- 3.3 Keyboard (30 keys): FUNCTION, PGM, WX/Skywarn, TRUNK, MANUAL, PRI, TUNE, TEXT, ATT, PAUSE, MODE, ▲, ▼, KEY LOCK/LIGHT, SCAN/Signal stalker, SEARCH, L/OUT, ENTER, CL, 1, ABC/2, DEF/3, GHI/4, JKL/5, MNO/6, PQRS/7, TUV/8, WXYZ/9, 0, ● and DELAY
- 3.4 LCD display: 16 characters and 4 lines
Frequency, Mode, ch, Bank, etc.
- 3.5 BNC type antenna connector
- 3.6 Earphone jack (D = 3.5 mm stereo)
- 3.7 External power jack and charge jack
- 3.8 PC Interface and Clone jack (D = 3.5 mm mono)
- 3.9 Battery compartment

4. FEATURES

- 4.1 10 bank and 1000 channel memories for trunking bank and channel combined with conventional mode memory
- 4.2 Multi trunking of Motorola (type I , II and hybrid analog system), EDACS and LTR
- 4.3 CTCSS and DCS Subaudible encoded squelch mode
- 4.4 Scan both trunking channels and conventional channels at same time
- 4.5 1500 ID memories in 10 ID banks, 5 sub-ID memories in each bank and each sub-ID memory has 30 ID locations.
- 4.6 Alphanumeric data entry
- 4.7 Clone the memory to other unit
- 4.8 Signal starker function (Total 200 lock out frequencies in signal starker, All Band 150, Police/Fire Band 50)
- 4.9 Pre-programmed Marine, CB, FRS/GRMS/MURS, Fire/Police, Aircraft, Ham and Weather frequencies
- 4.10 WX alert and SAME receiving with 10 FIPS (Federal Information Processing Standard) area code memories
- 4.11 Skywarn function

- 4.12 Attenuator control (Normal attenuator and Global attenuator)
- 4.13 Built-in power save circuit
- 4.14 Frequency tune mode (Frequency ▲ or ▼)
- 4.15 "Zeromatic" tuning system
- 4.16 Change the direction at the searching by ▲ (up) or ▼ (down)
- 4.17 60 channels/sec. scanning rate and 75 steps/sec. searching rate
- 4.18 2 second scan and search delay
- 4.19 Manual selection for channel
- 4.20 Scan mode [Cleared channels (000.000 freq.) are not scan.]
- 4.21 Deleting a frequency from a channel
- 4.22 1 limit search bank
- 4.23 Key lock for safety
- 4.24 Key tone and alert tone
- 4.25 16 characters and 4 lines dot matrix LCD (Indicate channel numbers, Frequency, ID number and the data on the LCD)
- 4.26 Backlight LCD and key pads
- 4.27 Low battery indicator by LCD
- 4.28 Crystal filter for 2nd IF and Ceramic filter for 3rd IF section
- 4.29 Belt clip and two battery holder attached
- 4.30 50 lock out frequencies per search bank, Fire/Police, Aircraft, Ham, Limit search (Totaling 200 frequencies)
- 4.31 Frequency lock-out review and Channel lock-out review
- 4.32 155 preprogrammed frequencies
